Note for Henri Silberman's attention

In Re 582-520

Attached to the draft application is a proposed page along slightly different lines where the burning rate is verified in connection with the treated cellulose rather than to the ultimate produce and where both upper and lower limits are given to the burning rate as well as preferred limits.

Point out that a burning rate for the treated product may be set forth as well, but that the present description may not be sufficient to properly characterize the invention.
